

Deep Learning for Natural Language Processing

Introduction to Module 2

Marco Kuhlmann & Richard Johansson

Module 1: Representation and categorisation

- **Lectures**

building blocks for representation learning; embeddings

- **Applications**

text categorisation tasks

- **Assignment**

word sense disambiguation

Feedback on Module 1

How challenging are the video lectures and coding exercises?

Feedback on Module 1

Are there enough video lectures and coding exercises?

Feedback on Module 1

Workload and level of effort

Module 2: Structured prediction tasks

- **Lectures**

neural architectures that produce structured outputs

- **Applications**

named entity recognition, relation extraction

- **Assignment**

dependency parsing

Search and learning

The diagram shows the equation $\hat{y} = \operatorname{argmax}_y \operatorname{score}(x, y; \theta)$ with four labels connected by vertical lines: 'predicted output' points to \hat{y} , 'input' points to x , 'candidate output' points to y , and 'model parameters' points to θ .

predicted output

input

$$\hat{y} = \operatorname{argmax}_y \operatorname{score}(x, y; \theta)$$

candidate output

model parameters

Linguistic representations

Algorithmic approaches

- **Exhaustive search**

Cast structured prediction as a combinatorial optimisation problem over the set of target representations.

Viterbi algorithm, Eisner algorithm

- **Greedy search**

Cast structured prediction as a sequence of classification problems: at each point in time, predict one of several options.

window-based part-of-speech tagging, arc-standard algorithm

Announcing SyntaxNet: The World's Most Accurate Parser Goes Open Source

Thursday, May 12, 2016

Posted by Slav Petrov, Senior Staff Research Scientist

At Google, we spend a lot of time thinking about how [computer systems](#) can [read](#) and [understand human language](#) in order [to process it](#) in [intelligent ways](#). Today, we are excited to share the fruits of our research with the broader community by releasing [SyntaxNet](#), an open-source neural network framework implemented in [TensorFlow](#) that provides a foundation for [Natural Language Understanding](#) (NLU) systems. Our release includes all the code needed to train new SyntaxNet models on your own data, as well as *Parsey McParseface*, an English parser that we have trained for you and that you can use to analyze English text.

For you and that you can use to analyze English text.

of our research with the broader community by releasing [SyntaxNet](#), an open-source neural network

Universal Dependencies

Universal Dependencies (UD) is a framework for consistent annotation of grammar (parts of speech, morphological features, and syntactic dependencies) across different human languages. UD is an open community effort with over 300 contributors producing more than 150 treebanks in 90 languages. If you're new to UD, you should start by reading the first part of the Short Introduction and then browsing the annotation guidelines.

- [Short introduction to UD](#)
- [UD annotation guidelines](#)
- More information on UD:
 - [How to contribute to UD](#)
 - [Tools for working with UD](#)
 - [Discussion on UD](#)
 - [UD-related events](#)
- Query UD treebanks online:
 - [SETS treebank search](#) maintained by the University of Turku
 - [PML Tree Query](#) maintained by the Charles University in Prague
 - [Kontext](#) maintained by the Charles University in Prague
 - [Grew-match](#) maintained by Inria in Nancy
 - [INESS](#) maintained by the University of Bergen
- [Download UD treebanks](#)

If you want to receive news about Universal Dependencies, you can subscribe to the [UD mailing list](#). If you want to discuss individual annotation questions, use the [Github issue tracker](#).

Current UD Languages

Information about language families (and genera for families with multiple branches) is mostly taken from [WALS Online](#) (IE = Indo-European).

| | | | | | | |
|---|---|---------------|---|--------|---|-----------------------|
| ▶ |  | Afrikaans | 1 | 49K |  | IE, Germanic |
| ▶ |  | Akkadian | 1 | 1K |  | Afro-Asiatic, Semitic |
| ▶ |  | Albanian | 1 | <1K | W | IE, Albanian |
| ▶ |  | Amharic | 1 | 10K |  | Afro-Asiatic, Semitic |
| ▶ |  | Ancient Greek | 2 | 416K |  | IE, Greek |
| ▶ |  | Arabic | 3 | 1,042K |  | Afro-Asiatic, Semitic |
| ▶ |  | Armenian | 1 | 52K |  | IE, Armenian |
| ▶ |  | Assyrian | 1 | <1K |  | Afro-Asiatic, Semitic |
| ▶ |  | Bambara | 1 | 13K |  | Mande |
| ▶ |  | Basque | 1 | 121K |  | Basque |

Module 3: Generation tasks, research outlook

- **Lectures**
neural architectures for text generation
- **Applications**
machine translation, summarisation
- **Assignment**
your own project

Project

- You send us a one-page project sketch until 18 May, 8:00 AM.
- We give feedback on your sketch by 20 May.
- You pitch your project during a Zoom session 25–26 May.
- You send us your project report, deadline 19 June.
